I came across your profile while browsing through OSGEO India site.

I am glad to share with you QGIS plugin **QRealTime** for seamless integration of GIS and ODK.

It has following three features:

1. **Make Online:** On the fly conversion of GIS layer into ODK form and publish to ODK Aggregate Server.
2. **Import:** download data from existing ODK form data into a empty GIS layer
3. **Sync:** Regularly sync layer with recent submissions

I would request you to review this plugin and also share with your colleagues and students at I2IT. Plugin is available at official QGIS plugin repository and can be directly installed from plugin manager.

I am looking forward for your valuable feedback and suggestions.

Keynote session 1: Delivered by Ms. Seema Nayyar, TomTom India Pvt Ltd.

Aim of tomtom is to use location services to enable mobility. What is open source? What is a license? A license are the guidelines to use a product or software. Open source licensing is the mixture of intellectual property and open source software.

Criteria of open source: Free redistribution, Must provide source code or make it available, Must allow derived works, Integrity of authors code must be maintained, Code should be traceable, No discrimination against persons or groups or fields of endeavour, Only one license required to secure rights, License must not be specific to product, License must not restrict our software

Three basic open source licenses: MIT (shortest and most used), APACHE (applied to both copyright and patent, once rights granted you can use forever), GPL.

Quantum GIS (QGIS): It is an open source GIS applications that supports viewing, editing and analysis of geospatial data. It provides 80 percent of the functionalities in ArcGIS, for free. Source code for QGIS is in C. Plug-ins create in Python script. You can connect and extract data in PostgreSQL.

pgAdmin: Open source administration and development platform for PostgreSQL. May be run on web or in a desktop application. Has a strong graphical interface and is used for maintenance of databases.

BlenderGIS: Open source GIS platform that supports 3d modelling and so on. Gets SRTM topographic data and adds height texture. Can further perform dereferencing and terrain analysis. Can import shapefiles and use attributes to define elevation 'Z'.

Some well-known GIS libraries:

- **GDAL library:** Supports raster and vector geospatial data formats. Released under MIT open source license. Supported in various languages. Ready-made command lines are provided for processing.
- **PDAL library:** Library for translation and manipulation of Point cloud data (Eg: LIDAR). Command line utilities are provided to process, filter, translate and query point cloud data. Supports other languages like python. Pdal maintains original component of data.
- **Open CV:** Stands for Open Computer Vision. Consists of computer vision algorithms that generate 3d point clouds from stereo cameras, identify objects, track camera movements. Open CV library can be used in ArcGIS python module.

Web mapping libraries:

- **Java script GIS libraries:** allows us to show our maps in a website or web link. Eg: Leaflet and openlayers.

Hope Foundation's International Institute of Information Technology (I²IT)

Hinjawadi, Pune- 411057

GIS servers:

- GeoServer: open source server written in java to share, process and edit geospatial data.
- Mapserver: open source server written in C

Github and Osgeo are open source forums.

Quiz at the end of session:

Login to kahoot.com and play quiz on open source. 31 people contested by logging in through their mobile phones. 3 Winners are given prizes by TomTom team. One of the winner was attending the session online, while two were present physically at the venue.

Keynote session 2: Delivered by Dr. Nitin Kumar Tripathi, Asian institute of Technology

Topic: Sensors in Geospatial systems

Data in geospatial systems:

- Essential data: Location through GNSS (eg: GPS). Positioning has become very easy with the advent of GPS, GLONASS, GAGAN are a few other examples of GNSS systems.
- Attributes: Environment data (Air, Water and soil), Climate data, Noise, Traffic, Health and others.

Smartphones: A mobile phone offering advanced capabilities, often with PC-like functionality. It is estimated that smartphone users are expected to rise by 84 % to 859 million by 2022. Smartphones have the following sensors: Compass, GPS, accelerometer, orientation sensor, magnetic sensor, Light sensor, noise sensor, camera, touchscreen sensor, pedometer sensor, fingerprint sensor, biometric sensor, barcode sensor, barometer, heart rate, temperature, air humidity (eg: galaxy S4), radiation sensor (eg: galaxy S4).

Wearable sensors for healthcare: Doctors today recommend patients use these sensors to monitor blood oxygen, glucose levels, blood pressure, eeg, body temperature and so on. If we are connected via internet to the hospitals database, the doctor will automatically receive all the information in real-time even if the patient is hundreds of kilometres away.

Internet of Things (IOT):

- IoT is simply the collection of several entities connected through a network provided by standardized protocols.
- Each connected entity is considered as a 'thing'.
- Application of IoT extends from home automation to smart cities.

Why we need sensors in GIS: Sensors that give data for geographic locations give us information and knowledge that can be used for decision making. Sensor are required for a place or for people. All places and people have locations. Therefore sensors data must be integrated to geographic position such as lat and long. Sensors just provide data. We must use this data to statistically or logically or mathematically convert this data to information. This information will then be accumulated knowledge that can be used for decision making.

Development of mobile online solar powered smart weather and air quality station (A project by AIT student N. Karthikeya whose guide is Professor Nitin. It is a master's thesis):

- **Intro:** Efficient environmental monitoring to evaluate conditions if the levels of parameters are exceeded. Agricultural, urban areas for environmental pollution and in residential locations to monitor any leakage of LPG and other gases.
- **Problem statement:** Traditional weather stations are very expensive (approx.: 10 million). They do not have GUI or web platform that is very important in modern world for continuous climate modelling. Global meteorological data sources give low resolution data, it is therefore difficult to give warnings for natural disasters occurring on a scale less than 25 sq km. Accurate assessment of climate changes generally require information with a resolution of 10 km. Furthermore, in remote areas, it is difficult to control due to low energy source. Solar energy source for the system will solve the problem. For this project, they spent only 25000 for making the weather station.
- **Objectives:** To design a low cost, efficient and mobile solar powered smart weather station interfaced with a microcontroller to support alert system.
- **Scope:** A weather station is to be developed using smart sensors for climate monitoring through interconnected sensors. The study is mainly carried to develop, implement and evaluate solar powered weather station and develop a web platform to monitor climate. The sensors were tested for the first time on a broadband and values were seen in Arduino terminal.
- **Applications:** Weather modification techniques: many countries have started activities to create new forests and increase green cover. Many countries such as India and Thailand have taken up weather modification techniques. In India it has been done successfully in AP and Telangana. Many IoT platforms can be used for data analysis and visualization.
- **Methodology:** All sensors are connected to micro-controller. Solar panels or solar batteries are used to power it. Data is sent to webserver. Thresholds are determined for all environmental factors and alerts are sent if values exceed the threshold. Data will be visualized in webserver so that people can see in which areas which parameters are exceeding the limits. The maps can be displayed on smartphones or desktop. All sensors connected to the micro-controller. The threshold values are set based on expert recommendation and scientific literature. Continuous and discreet data visualization available. Data visualization was decided for all sensors. All the data is stored. Sensors used: Anemometer for wind speed and wind direction; rain gauge, GPS sensor which is used to get location; PM 2.5 optical dust sensor to measure dust particles in air; DS-22 which gives temperature, relative humidity and heat index; SIM 900 A (GSM module).

Hope Foundation's International Institute of Information Technology (I²IT)

Hinjawadi, Pune- 411057

- **System architecture:** Sensors are connected to different ports of the microprocessor. Microcontroller is powered by solar energy. Data is received through Arduino and is converted to .csv file. Lot of API's available to connect sensors. Finally create widgets for alert notifications. Widgets are displayed on smart phone or desktop. Weather station is placed in AIT. The weather station has been tested in Bangkok city also. It is named AIT weather station and is placed above RS & GIS department at AIT.
- **Data validation and results:** Weather station data is compared with data from Thai meteorological department. Correlation is very high (for temp 0.9, pressure 0.93 and rain 0.97). Minimum, maximum and mean for all weather parameters are calculated for 24 hrs. Data is stored in order to visualize for entire week and month.
- **Conclusion:** Arduino based weather station has been developed with various sensors. The weather station has been validated. Data collected can be temporal – hourly, daily, weekly, monthly or yearly. Many applications are possible as location is in built.

Sensors play very important role to give vital data. This data can be used to get information and take appropriate decision for environmental problems faced in different geographic areas.

Agenda:

- FOSS4G and OSGeo
- Some examples of webgis using service oriented architecture
- Citizen science and field data aggregation
- Mapmint integrated web and mobile GIS platform
- Summary
- Q & A

ICT technology: The core factors behind the technology are software, data, standard and hardware.
FOSS4G: Free and open source solutions for geoinformatics. When we talk about a free software it means it has a license and copyright but it is free to be used by anyone. Which is why the source code is free. OSGeo maintains and overlooks open source software's in geospatial processing. OGC deals

with the standards. These standards allow for data sharing capabilities and creating open source softwares. OGC is an international consortium of which TomTom is a member. Open street map (OSM) data is voluntary data collection through people. This allows for availability of free and open data. Such data does not require dependence on government or international agencies for satellite images, that otherwise might require payment.

Open source initiative (OSI):

This organisation defines the licenses that are permissive as open source software. The licenses are defined under the Open Source initiative. In geospatial technologies the FOSS4G first started this consortium of open source software 14 years ago. MIT is one such institution that can give open source licences. Eg: GDAL is registered under MIT license.

Free and open source & proprietary software similarities:

- Use same language and tools
- Strive to achieve interoperability

OSGeo is a non-profit software foundation which is community driven voluntary software. It works with industry, academia and government to foster free and open source software, open source education, open geospatial science, open data and open standards. OSGeo manages a number of open source softwares like mapserver, Geoserver and so on by managing financially, or legally or by providing standards through OGC.

QGIS: Most popular open source geospatial platform. Has up to 300 different modules.

GrassGIS: 36 year old GIS package. Many functions in GRASS are used in QGIS because both are open source and therefore interoperability is possible. GRASS is a very strong tool for GIS data analysis.

GeoServer: It is an open source server for sharing geospatial data. To provide users solutions, GeoServer can be used to share results and maps with users to provide information. It is a standard way to send GIS data from web database to web browser.

OpenLayers: Maps can be rendered using this software.

GDAL and OGR: Supports drivers that can directly read raster datasets of different formats. Released under MIT style open source license. Similarly OGR is used for vector data of different formats.

PostGIS: Simple feature (point, line, and polygon) specification for SQL. It is used as a backend spatial database.

Data aggregation is done using FOSS4G through various open source software's on client side and server side.

Hope Foundation's
International Institute of Information Technology (I²IT)
Hinjawadi, Pune- 411057

Open Data Kit (ODK): Creates and authorizes forms for collecting data. The data can be imported directly into open source software like QGIS for processing.

Data collected can be stored in GeoServer. This can be extracted to QGIS for processing and later be published online using Mapserver (WPS & WFS).

Flood simulation model using GRASS GIS:

Inputs: DEM, Rainfall, Mannings coefficient, Infiltration value

Output: Flood stimulation map

It was done for Yamata River in Osaka by the speaker. Using this dynamic routing was done so that flooded areas could be avoided by people.

Citizen science: Participatory framework to produce scientific data, assist in scientific experiments and validation and to enable analysis through Software as Service (SaaS) for citizens.

Geospatial web services: Web Feature Service, Web Coverage Service, Web Map service and Web Processing Service.

Conclusion:

- Combine free and open software with open data and open standard
- Enable participatory data collection
- IoT will enable automatic data collection
- Efficacy of free and open source ecosystem to deliver solutions needs to be demonstrated.
- Seamless exchange of data with desktop GIS and online geoprocessing.

Keynote session 4: Delivered by Dr.NatrajVaddadi

Topic: Field data aggregation using open source tools

ODK Basics: 3 major components namely Build, Collect and Aggregate:

- Build a data collection form or survey
- Collect the data on a mobile device and send it to server

Hope Foundation's International Institute of Information Technology (I²IT)

Hinjawadi, Pune- 411057

- Visualize and analyse data

ODK Aggregate:

- Can be installed in following server: Google app Engine, Tomcat server, AWS
- It can be downloaded as a VM.

Using ODK:

- Build form
- Upload to ODK Aggregate (Server)
- Download to android device
- Collect survey data
- Upload survey data to aggregate
- Push to map for visualization

ODK collect:

- ODK collect can be downloaded in play store in android mobiles.
- ODK collect configuration is explained hands-on by Dr.Natraj.

ODK Build

- Used to build the form in which data is collected.

Keynote session 5: Delivered by Akshat Jain, Tech Lead and SatyamGawali, Lead Consultant, SEARCE

Topic: Google maps platform: A deep dive into APIs and their varied applications

About us: SEARCE is a cloud computing company. Provide API solutions. Partnered with google and fastest company to become Google's location based partner. 14 years' work experience. Awarded partner of the year with google for 4 years.

Timeline of google: Talked a little bit on how google evolved since 2004 by acquiring meaningful companies that later allowed them to start google maps and google earth. For the purpose of google earth, they started acquiring satellite imagery. In 2016, google acquired landsat 8 imagery for whole globe. In 2019 google launched AR in google maps.

Intro:

- Most data in the world today has a location component, which gives context to the data. Location based data allows for geospatial analysis. The results of such analysis can be used to provide solutions in various fields.
- Location data creates new value for enterprises as they improve customer experience, optimize company operations and enable strategic decisions.

Hope Foundation's International Institute of Information Technology (I²IT)

Hinjawadi, Pune- 411057

Why use google platform:

- Provides rich, accurate and real time data
- Fast and scalable performance
- Global coverage (covered almost 99% of the world)
- Efficient operations. Eg: Estimation of traffic by google maps.
- Google maps APIs are used by more than 5 million apps and websites.

BigQuery: It is a SaaS product where SQL is used to collect data and show the location of data points over a google maps interface. The attributes of data points can also be viewed. Eg: Tree health data for a park in Brooklyn was collected and shown as point data on a google maps interface. The attributes of tree health were also viewed.

How solutions can be given using google maps:

- Ridesharing Eg: OLA, UBER.
- Asset tracking Eg: AMAZON and FLIPKART for tracking products
- Gaming Eg: Location based games like walking dead and pokemon.

Google maps API's

- GM API's are a visual canvas for customer engagement, business planning and productivity improvements.
- Divided into three categories: Maps (Products: Javascript API, Street View Image API, Static Maps API, Embed API), routes (Products: Directions API, Distance Matrix API, Roads API) and places (Products: Places API, Geocoding API, Geolocation API, Time zone API). The above mentioned products are widely used by companies around the globe to achieve their goals.

Description of few API's:

- Places API: Find detailed information about places across a wide range of categories.
- Geocoding API: Find lat long values for given location.
- Directions API: Search for directions for several modes of transportation. Also does route optimization.
- Distance matrix API: Provide travel distance and time for a matrix of origins and destinations.
- Roads API: Improve data visualization through specific capabilities such as speed limits and traffic intensity.

Impact on daily lives:

- happierTrack: plug and play product

Hope Foundation's

International Institute of Information Technology (I²IT)

Hinjawadi, Pune- 411057

- Quick Ride: Select your location and destination and carpool with other people. This is done by Distance matrix API.
- Rebel Foods: Pinpointing customers for food delivery with google maps platform. Eg: Fasoos
- Travel: Real time tracking and suggestive algorithms. Eg: Redbus
- Service providers: Urbanclap

Keynote session 6: Delivered by Mr. Ajay Kumar, Geospatial Business Analyst, Kalinoos Pvt. Ltd.

Topic: Spatial data web publishing using GeoServer

Kalinoos used open source data and software's to provide services to users.

Web mapping services: WMS, WFS, WCS

Case studies:

- Case study 1: Asset mapping of forest species in Nallamalla. Map habitations and areas where different animals roam in the thick forest.
- Case study 2: Mapping route of optical fibres. You can view location and 360 degree view at each pole.
- Case study 3: Aquifer mapping in semi-arid region. Based on geological features of sub surface of the earth, we can map aquifers. This map was published in WMS. You can also view check dams as point data and overlay different features on base layers. You can further view SAR satellite imagery from Sentinel-1 for the region. This is done to view where water is accumulating.
- Case study 4: Asset mapping of plants (Horticulture). How many plantations are there of specific type within a grid. The attributes of each plant are its type, yield time, lat and long, plot number, date.

Objectives:

- Define a workspace on GeoServer.
- Connecting to existing data files or layers.
- Expose spatial dataset as an OGC compliant service.
- Visualize WMS/WFS services and work with it.

Primitives of GeoServer:

- Workspace: Organising items by grouping (eg: stores and layers)
- Store: Connects to a data source of vector and raster.
- Layer: A spatial dataset having geographic features to be displayed as a map.
- Layer group: A collection of layers.

Hope Foundation's
International Institute of Information Technology (I²IT)
Hinjawadi, Pune- 411057

Hands on session: Data was shared with students and a hands on spatial data web publishing session was conducted. The sample data was that of Rajhundry.

Keynote session 7: Delivered by Dr. Shiva Reddy Koti, IIRS, ISRO

Topic: QRealTime: Next generation data management framework

How to integrate desktop, mobile and web. Data is coming from many users through sensors, mobiles and IoT. Data needs to be updated automatically or semi-automatically and similarly even data products must be updated automatically or semi-automatically on both mobile and web platform.

Next gen technology for data collection:

- XForm: Next gen. XML application for data collection and aggregation. Supports all three forms of data collection i.e. point, line and polygon.
- OpenRosa Ecosystem: Advanced data collection through non-proprietary form formats. Work with or without internet.

Proposed approach for gis data collection and handling through QRealTime plug-in:

- Create survey form in QGIS, upload into server, and download survey form in odk format in mobile form to conduct survey. Once data is collected in mobile, it is sent back to server.
- GIS data creator and analyst can update their created and analysed vectors automatically into cloud using 'make online' and 'import' options that will be available if you add this plug-in in QGIS.

Application:

- Humanitarian crisis: Collecting data and showing the action ready input in real-time during floods, landslides and earthquakes.

Salient Features of QRealTime:

- Extendable: Future ready and open source
- Scalable: Fast and efficient
- Portable: minimum configuration required
- Interoperable: OGC complain
- Offline support

Demo of QRealTime plug-in in QGIS. Go to QRealTime settings in QGIS, enter server address, username and password.

विषय — सन २०१९-२० मधील गुणवत्ता सुधार योजनेतर्गत केंद्रीय पध्दतीने हिशोब सादर करण्याबाबत.

संदर्भ — १. पत्र क्र. साफुपुवि/निववि/७१३, दि. १५ नोव्हेंबर, २०१९.

२. पत्र क्र. साफुपुवि/निववि/७९९, दि. २३ डिसेंबर, २०१९.

३. पत्र क्र. साफुपुवि/निववि/८००, दि. २३ डिसेंबर, २०१९.

४. पत्र क्र. साफुपुवि/निववि/२९, दि. १५ जानेवारी, २०२०.

महोदय/महोदया,

वरील संदर्भीय विषयास अनुसरून कळविण्यात येते की, सन २०१९-२० मध्ये गुणवत्ता सुधार योजनेअंतर्गत सादर केलेल्या प्रस्तावापैकी गुणवत्ता सुधार योजनेच्या मार्गदर्शक तत्वांस अनुसरून पात्र ठरलेल्या यादीतील महाविद्यालये व परिसंस्थांना संदर्भीय पत्रान्वये अर्थसहाय्य मंजूर केलेले आहेत.

सादर परिपत्रकामध्ये खालीलप्रमाणे उल्लेख करण्यात आला होता : —

“राज्य, राष्ट्रीय व आंतरराष्ट्रीय पातळीवरील कार्यशाळा/चर्चासत्रे/परिषदांचे आयोजनासाठी महाविद्यालय/परिसंस्थांनी त्यासाठी वापरलेल्या निधीची मार्चमध्ये होणा-या लेखापरिक्षण शिबीरानंतर प्रतिपूर्ती होते. सादर परिपूर्ती लवकर होण्याच्यादृष्टीने कार्यशाळा/चर्चासत्रे/परिषदांचे आयोजनानंतर वरील सर्व बाबींची पूर्तता केल्यानंतर संबंधित कार्यशाळा/चर्चासत्रे/परिषदांच्या हिशोबांची कागदपत्रे विद्यापीठाकडे त्वरीत सादर करावीत व त्याचप्रमाणे महाविद्यालयाच्या बँक खात्यासंबंधीची माहिती विद्यापीठ संकेतस्थळावर अपलोड करण्यात यावी. जेणेकरून आयोजित केलेल्या कार्यशाळा/चर्चासत्रे/परिषदांच्या खर्चाची प्रतिपूर्ती विद्यापीठाकडून लवकर करणे सुकर होईल.”

परंतु विद्यापीठाने घेतलेल्या निर्णयानुसार सन २०१९-२० या आर्थिक वर्षामध्ये ज्या महाविद्यालये/परिसंस्थांना गुणवत्ता सुधार योजनेअंतर्गत अर्थसहाय्य मंजूर करण्यात आलेले आहे, त्यांनी खाली नमूद केलेल्या ठिकाणी केंद्रीय पध्दतीने हिशोब सादर करणे अनिवार्य आहे. त्यानंतर विद्यापीठामार्फत कोणतेही हिशोब स्विकारले जाणार नाहीत व कोणत्याही प्रकारे अर्थसहाय्य अदा कोडे जाणार नाही, याची नोंद घ्यावी.
